Macros

Recap

### Automates certain tasks

- Usually simple command-line stuff
- Compiling multi-file programs
- Archiving/extracting
- Software installation
- Often used to manage builds
  - Compiles only as necessary
    - Uses file modification times to decide when it is necessary

## **Basic Make**

## Make Rules

Introduction to Make

Kurt Schmic

Intro

Basic Make

Dependencies

Lines

Comman Prefixes

Invocation

Macro

Recap

A basic makefile consists of rules

```
target : dependencies
<tab>command1
<tab>[command2]
```

- The tab character precedes the rule
- The target is (usually) a file to be created
- Each command is executed in its own shell<sup>1</sup>

# Make Example

Introduction to Make

Kurt Schmic

Intro

Basic Make

Dependencies

Continui Lines

Command

Invocatio

Macros

Recap

E.g.

```
program : main.c
   gcc main.c -oprogram
```

- main.c should already exist
  - Or, there's another target that creates it
- main.c will only be compiled if:
  - 1 program doesn't exist, or
  - 2 main.c is newer than program

## **Dependency Recursion**

Introduction to Make

Kurt Schmid

Intro

Basic Make Dependencies

Lines

Prefixes

iiivocatio

Macros

Dependencies are checked recursively down the tree:

```
program : main.o
gcc main.o -oprogram
main.o : main.c
gcc -c main.c
```

- Nothing happens if program is newer than main.o, and main.o is newer than main.c
- If main.o doesn't exist, or is older than main.c, it will be rebuilt, then program will be rebuilt
- If program doesn't exist, or is older than main.o, it will be rebuilt

# Slightly More Involved Example

#### Introduction to Make

Kurt Schmid

Intro

Basic Make Dependencies

Lines

Command Prefixes

Invocatio

Macros

чесар

```
program : main.o service.o
gcc main.o service.o -oprogram

service.o : service.c service.h
gcc -c service.c

main.o : main.c service.h
gcc -c main.c
```

- If main.c is updated, then main.o and program are rebuilt
- If service.c is updated, then service.o and program are rebuilt
- If service.h is updated, everybody is updated

IIIVOCALIOI

Macro

Recap

### A target may simply depend on other targets:

```
all: this that other

this: this.c
gcc this.c -o this

that: that.c
gcc that.c -o that

other: other.c
gcc other.c -o other
```

Macro

Recap

Use \ to continue a dependency list or a command program are rebuilt

```
program : main.o curses.o utils.o keyboard.o \
deck.o suits.o
gcc -oprogram main.o curses.o utils.o keyboard.o \
deck.o suits.o
...
```

## **Multi-Line Commands**

#### Introduction to Make

Kurt Schmid

Intro

Basic Make Dependencies

### Continuing Lines

Command Prefixes

mvocanc

iviacros

So now you can pass more than one line to the shell

- Beware, the shell won't get any newlines (you escaaped them)
- So, use the shell's separator (most shells use;)

```
input :
    f='mktemp';\
    i=1;\
    while [ $$i -le 10000 ];\
        do echo $$i >> "$$f";\
        i='expr $$i + 1';\
    done;\
    shuf "$$f" >> input
    rm "$$f"
```

Note, make uses Bourne (or, a minimal, Bourne-compliant) shell by default

Recar

Turn of make echo by preceding line with a @

```
blah :
    @echo "Don't say this line twice"
```

- If any command returns an unsuccessful status, make reports the error and exits
- Precede a line with a to have make ignore the status
- Note, each of those rm statements happens in a separate shell

```
clean :
   -rm program # fails if program doesn't exist
   -rm *.o  # We want this to happen, regardless
```

## Invocation

# Specifying Input File

Introduction to Make

Kurt Schmic

Intro

Basic Mak

Continuing

Command

Invocation

Macros

Recap

■ Specify a makefile using the -f option to make:

```
$ make -f someMakeFile
```

- If not specified, GNU make looks in the current directory for:
  - 1 GNUmakefile<sup>1</sup>
    - makefile
  - 3 Makefile

¹Only use this if file has Gnu make extensions ← 🗗 ト ⋆ ≣ ト ⋆ ≣ 🔻 🔊 ۹ 🧇

# Specifying a Target

#### Introduction to Make

Kurt Schmid

Intro

Basic Make Dependencies

Lines

Prefixes

Invocation

Macros

Recap

Make allows you to specify target(s) make [options] [target]

- If no target is specified, make builds the first target it finds
- -n (dry run) is another handy option
  - Just print commands that would execute, w/out executing them

# Phony Targets (Gnu only)

#### Introduction to Make

Kurt Schmid

Intr

Basic Make Dependencies

Lines

Prefixes

Invocation

Macros

Reca

- Some targets exist for convenience
- We don't actually want to produce a file
- Commands won't run if a file of the same name exists
- We can declare targets as phony:

```
.PHONY : clean

clean :
    -rm program # fails if program doesn't exist
    -rm *.o # We want this to happen, regardless
```

■ No times are compared, commands run every time

## Defining Macros in a Makefile

Introduction to Make

Kurt Schmid

Intro

Basic Mak

Continuir Lines

Command

Invocatio

Macros

≺есар

### Macros can be defined in a makefile:

```
OBJS = main.o curses.o utils.o keyboard.o \
           deck.o suits.o
cc = gcc
CFLAGS =
program : $(OBJS)
  $(cc) $(CFLAGS) $(OBJS) -o program
main.o : main.c
  $(cc) -c $(CFLAGS) main.c
$(OBJS) : sysdefs.h
```

## Macro Substitution

#### Introduction to Make

Kurt Schmid

Intro

Basic Mak

Lines

program : main.c service.h
$(cc) $(CFLAGS) $< -0 $0
...
```

## Choosing a Different Shell

#### Introduction to Make

Kurt Schmid

Intr

Basic Make

Continui Lines

Command Prefixes

Invocatio

Macros

Recap

- If you want to use a different shell, say, bash, to interpret the commands
- Set the SHELL variable at the top to modify all commands:

```
SHELL := /bin/bash
...
```

You can do this for individual targets:

## Suffix Rules

#### Introduction to Make

Kurt Schmid

Intr

Basic Make

Lines

Command Prefixes

iiivocanc

Macros

Some rules easy enough to be generalised

- If target has the same name as a dependency, but different suffix
- E.g., compile C files into object code

- Other dependencies can be named
- Can also be specified this way:

```
.c.o : $(cc) -c $(CFLAGS) $<
```

IIIVocatio

Macros

Recap

- Make files can do anything you do at the command line
- Care has to be taken to make them portable
- We've looked at fairly simply makefiles
  - Still wildly useful
  - Makefile might call other makefiles
  - Macros can be defined in a separate file, used by several makefiles
